Software Engineering Group Coursework

Remote Health Monitoring

Group number: 34

Student ID	Student Name
2613517	Henry Davis
2206772	Areeb Inayat
2627913	Matthew Hill

1. Planning (20%)

Conceptual model
Personas → Product Vision → User Stories → Features → Prototype → Tests

1.1 Personas

Persona Name	Role/User type	Goals	Pain Points	Related User Stories (IDs)
Elder patients	Patient/user	- Monitor basic health(heart rate, daily activity, wellbeing) - Live independently at home - Receive professional advice	- Finds complex apps confusing and difficult to use - Limited confidence with technology and small text interfaces	S1, S3
Healthcare Professionals	Professional/ admin	- Quickly understand patient trends - Make evidence based decisions - Save time during consultations - Communicate effectively	- Data overload - Time pressure - Poorly designed interfaces - Inaccurate input	S2, S3

Note: You need to have at least two personas. The personas should be used to justify the product vision and user stories.

1.2 Product Vision

FOR older adults, carers, and healthcare support staff
WHO need a simple, reliable way to track basic health information and stay informed without relying on complex medical systems
The LiveEasier app is a web-based health-monitoring application
THAT enables easy daily health input, provides clear feedback, and supports communication between older adults and those who care for them
UNLIKE traditional clinical systems that are complex and overwhelming for older adults
OUR PRODUCT offers an intuitive, accessible interface designed specifically for older users, with monitoring features that support independence without replacing clinical decision-making.

Our product vision is based on elderly users who struggle with complex technology, forget medication, and need reassurance while living independently. So we designed a simple, accessible remote monitoring app that prioritises ease of use and carer communication.

Note: This product vision should be derived from the defined personas and guides backlog prioritisation and design decisions.

1.3 Meeting Logs (Appendix)

2. Story Writing (20%)

2.1 Product Backlog and User Stories

Story ID	Feature (epics)	Story Title	User Story	Acceptance Criteria	Priority (Must / Should / Could)	Justification of prioritisation / Trade-off	Story Owner
S1	Health monitoring form	Log Daily Health Information	As an older adult managing multiple health conditions, I want to easily log my daily health information, so that I can understand how my health is changing over time and share accurate information with my healthcare professional.	Given the user is on the health data entry form when they interact with the input fields then they should be able to enter data simply Given the user has completed the form when they submit their health data then the system should display a clear confirmation message indicating the submission was successful Given the user has submitted valid health data when	MUST	This is a core feature that directly supports independent living and facilitates communication between older adults and healthcare professionals	Henry

				the system processes the submission then the data should be saved and stored correctly in the user's record			
S2	Data Visualisation	View health trend graph to more easily visualise changes in health	As a healthcare professional monitoring multiple patients, I want to view clear, clinically useful graphs of a patient's logged health data, so that I can quickly identify trends, detect early warning signs, and make informed decisions about their care.	Given the system has stored patient health data with time stamps when the healthcare professional opens the graph view then the graph should display accurate, time-stamped data directly from the patient's logs Given the healthcare professional accesses the graph when the system retrieves and processes the patient's data then the graph should load quickly without requiring any manual data manipulation from the user	Should	This feature directly supports clinical workflow, enhances decision-making, and improves the quality and safety of patient care. It transforms raw data into actionable insight, which is exactly what healthcare professionals need.	Matthew
S3	Healthcare Professional feedback	Provide feedback to patients	As a healthcare professional monitoring	Given the healthcare professional	Should	The feedback feature enables clinicians to	Areeb

			patient-submitted health data, I want to send clear, personalised feedback directly through the app, so that patients understand their progress and know what actions to take next	is viewing a patient's record when they enter a message and choose to send feedback then the system should successfully deliver the feedback to the patient Given the patient has received new feedback when they open the log in the app the feedback should be displayed in a clear, readable format		turn patient data into clear guidance, improving safety, supporting early intervention, and keeping patients engaged without requiring extra appointments.	
S4	User management	Remove User Accounts	As a system administrator responsible for platform security and maintenance, I want to remove user accounts when necessary, so that I can maintain system integrity, protect data, and ensure only authorised users have access	Given the system administrator is on the user management screen when they search for a user and select that user from the results then the system should display the selected user's details for removal Given a user is logged into the system when they attempt to access the	could	Removing users is necessary to maintain security, protect sensitive data, and ensure only authorised people can access the system	Henry

				user removal function then the system should allow access only if the user has system administrator permissions			

2.2 Sprint 1 Summary

Item	**Sprint 1 (Weeks2-6)** Discovery, MVP design and partial implementation	**Sprint 2(Weeks7-11)** Refinement, testing & evaluation
Planned stories (Plan - P)	S1, S3	**S2, S4**
Delivered stories (Done - D)	S1	**S2, S3, S4 (S4 implemented only as supporting admin functionality)**
Stories not completed (No - N)		
Key change planned for Sprint 2	Deliver S3	**N/A**

Note: Stories marked "P" or "N" should be reflected upon in Sprint learning or retrospectives.

2.3 Group contribution and Individual contribution (Appendix)

3. Design (20%)

3.1 Design Models and Evidence

Diagram	Type (Class / Sequence)	Purpose	Related User Stories (Story IDs)	Design decision rationale
D1	Class	Initial diagram for the health form and patient health data.	S1	First version to help model the health form feature. Initial direction before refinement.
D2	Class	Relationship between User and UserHealthLog (focus on User)	S1	Clarifies new and refined data structure
D3	Class	UserHealthLog diagram and its attributes	S1, S3	Clarifies system behaviour

D4	Class	UserHealthForm, User, and UserHealthLog as implemented in the Flask project.	S1, S3	Clarifies refined system behaviour
D5	Sequence	Full sequence diagram for app.	S1, S2, S3, S4	Gives full overview of final app features.

Note: You are **not penalised** for modifying or discarding models if justified by learning.

3.2 Stories and Evidence

For each story marked as "Done" in Sprint 1 must be mapped to at least one test.

Story ID	**Evidence Type (UML Diagram / Git Commit ID(s) / Test Evidence: testcases / their results)**	**Reference (file / commit / screenshot)**	**Acceptance Criteria Met (Yes / Partially / No)**	**Notes (if partially completed)**
S1	Git commit	https://github.com/mxh1247/bus-34-coursework/commit/26da2a736b0cbb695a63584f54bae94ca691c2e8	Yes	Implements username-based login, the health form, database saving, and submitted health log display.
S1	Git commit	https://github.com/mxh1247/bus-34-coursework/commit/bad6663a76f0db35da60beb7a6c3b60b17edf581	Yes	Adds the patient comment field to give context to each health log.
S1	Diagram	D1, D2, D4, D5	Yes	Diagrams show initial form design, user/log relationship, final data model, and health log submission sequence.
S1	Test screenshot		Yes	User enters health data, submits the form, receives confirmation, and the saved data appears in their log list.

S2	Git commit	https://github.com/mxh1247/bus-34-coursework/commit/79110df175b758027f3732f12c388609796dd591	Partial	Planning evidence for the graph feature story.
S2	Git commit	https://github.com/mxh1247/bus-34-coursework/commit/30f10435919c91c6a94244496e8ed3f7ccb4815c	Yes	Implements graph pages for patient/admin viewing using stored health log data.
S2	Diagram	D5	Yes	Final sequence diagram shows patient/admin graph viewing workflow.
S2	Test screenshot		Yes	Stored health log data is displayed as graphs for both patient and admin/healthcare professional views.
S3	Git commit	https://github.com/mxh1247/bus-34-coursework/commit/30f10435919c91c6a94244496e8ed3f7ccb4815c	Yes	Implements admin/healthcare professional comments on patient health logs.
S3	Diagrams	D3, D4, D5	Yes	Diagrams show admin_comment in the model and the admin comment workflow.
S3	Test screenshot		Yes	Admin opens a patient's logs, adds/edits a comment, saves it, and the comment is displayed on the user's log list.
S4	Git commit	https://github.com/mxh1247/bus-34-coursework/commit/26da2a736b0cbb695a6358	Partial	Basic user deletion exists, but the original S4 criteria are not fully met because there is no user search or

		4f54bae94ca691c2e8		proper admin permission system.
S4	Test screenshot		Partial	Admin can delete a user from the database, but S4 should be treated as a supporting admin function rather than a completed core feature.

Note: If a story is marked "Done" without evidence, it **will not be treated as complete**.

4. Working Prototype and Implemented Features (20%)

Submit a **short video (3-5 minutes)** that demonstrates the implementation of 2 core end-to-end features + refinement of Sprint 1 feature. Each demonstrated feature must be traceable to user stories and acceptance criteria. The video should be submitted under the **"Product Video"** assignment on Canvas.

5. Testing and Evaluation (20%)

Story ID	Acceptance Criteria	Test Performed	Outcome (Pass / Partial / Fail)	Accessibility Checked	Notes (If partially tested)
S1	Form submits, data saved to database	Manual test	Pass	Keyboard only	
S2	Accurate graph made from inputs and can be viewed by patient and professional	Manual test	Pass	Keyboard only	
S3	Healthcare professionals can view logs and graphs, and submit feedback which is saved to the database	Manual test	Pass	Keyboard only	

S4	System admins can successfully remove users from the database	Manual test	Partial	Keyboard only	

Note: You may have more than one test per story. At least one test per story is required.

APPENDIX

A. Group Contribution

Story ID	Story Title	Predicted workload in hours	Actual workload in hours	Status (TODO/In progress / DONE)	Owner name
S1	Log Daily Health Information	3	4	DONE	Henry
S2	View health trend graph	2	3	DONE	Matthew
S3	Provide feedback to patients	2	2	DONE	Areeb
S4	Remove user accounts	1	1	In progress	Henry

B. Individual Contribution

Team member	Role (s)	Stories Owned	Evidence (Git / Diagram / Test)	What could have been improved with more time?
Matthew	Programming and planning	S2	Git commits: 6321bbd, 9bd6fdd, 631e1e6, 996363e, 26da2a7, bad6663, 79110df, 30f1043, 51a818f. Manual tests: S1, S2, S3, S4.	Proper login page with authentication, password hashing etc.
Henry	Class diagrams and planning	S1, S4	Git commits: 1cb4e8c, 5e69d6d, 118e3e1, 43d889f, 4c31f1a, 035dff2. Diagram: D1, D2, D3, D4.	Further refinement of diagrams
Areeb	Sequence diagrams and planning	S3	Git commits: 7b7f519, ae6ead4, aad88f5, 00cd9d4. Diagram: D5.	Further refinement of diagrams

C. Meeting Logs

You are required to schedule at least 2 meetings with your Customer (TA).

Meeting ID	Team attendees	Customer (TA's name)	When	Agenda items	Actions and Owner
M1	Henry	Aliya Kassen	25/03/2026	Talked through sprint 1 and explained user stories	
M2	Matthew Henry Areeb	Aliya Kassen	26/03/2026	Talked through sprint 2 plans and possible feature changes	Decided that S4 was not sufficient to fulfil the requirement of 3 full features, planned S2 instead, done by Matthew.
M3	Matthew	Wendy	28/04/2026	Talked about whole app and show functionality	

Meeting Diary for Team meetings				
Meeting ID	**Team attendees**	**When**	**Agenda items**	**Actions and Owner**
M1	Henry, Matthew, Areeb	04/02/2026	Chose challenge and general division of labour.	Set up git repository
M2	Henry, Matthew, Areeb	11/02/2026	Planned out personas and product vision	Henry came up with elderly patient persona. Matthew came up with healthcare professional persona. Areeb produced a product vision based off this
M3	Henry, Matthew, Areeb	18/02/2026	Decided on first two user stories (S1, S3) and started code	Henry came up with the form feature and wrote user story, acceptance criteria etc. Areeb came up with giving feedback feature. Matthew started the skeleton of the code.
M4	Henry, Matthew, Areeb	25/02/2026	UML diagrams	Henry did class diagram. Areeb did sequence diagram. Matthew coded the form feature and tested it.
M5	Henry, Matthew, Areeb	04/03/2026	Sprint 2 agenda	Matthew decided on the graph feature and wrote user story, acceptance criteria etc. Henry decided on removing users feature
M6	Henry, Matthew,	25/03/2026	Refined UML and	Henry and Areeb refined their

	Areeb		code	class and sequence diagrams to fit with new features and Matthew coded the new features.
M7	Henry, Matthew, Areeb	28/04/2026	Final details	As a group we've gone over the final details before submission

Note: Meeting logs are not marked directly and are used only as supporting evidence.
